Visualization of Random Slope Models

Mathematical Formulation of Random Slope

The classical linear model is characterized by:

$$Y_i \sim N(\mu_i, \sigma^2)$$

$$\mu_i = X_i\beta$$

The classical linear mixed model is characterized by:

$$Y_{ij}|U_i \sim N(\mu_{ij}, \sigma^2)$$

$$\mu_{ij} = X_{ij}\beta + U_i$$

$$[U_1, \dots, U_M]^T \sim N(0, \Sigma)$$

- **observations:**  $Y_{ij}, j = 1 \dots J_i$ 
  - repeated measures  $j$  on individual  $i$
  - fixed effects  $X_{ij}$
  - random effects:  $U_i; i = 1, \dots, M$

Mathematical Formulation of Random Slope

- Notice that the random effects model shrinks values towards the mean!
- This is because the individuals random effects are drawn from a normal distribution with more mass near the mean!
- However, the random intercept model allows us to draw inference on the entire (unobserved) population of pigs regarding their weight!

Visualization of Random Slope Models

Mathematical Formulation of Random Slope

We may summarize a random slope model by the following equations:

$$\begin{aligned}Y_{ij}|U_i &\sim N(X_{ij} + U_{i1} + U_{i2}W_{ij}, \sigma^2) \\ \mu_{ij} &= X_{ij}\beta + U_i \\ (U_{i1}, U_{i2}) &\sim MVN(0, \Sigma)\end{aligned}$$

Mathematical  
Formulation of  
Random Slope

- $X_{ijp}$  and  $W_{ij}$  are all covariates
- The coefficient on  $W_{ij}$  is different for each subject but come from a distribution
- $U_{i1}$  are random intercepts
- $U_{i2}$  are random slopes
- Note that they could be correlated
- $\Sigma$  is a 2 by 2 covariance matrix

## HIERARCHICAL MODELS!

# Mathematical Formulation of Hierarchical Models

## Random Effect Model

Anthony-Alexander Christidis

Hierarchical (4-level) models may be summarized by the following. Note that real-life examples will follow!

$$Y_{ijklm} \sim N(X_{ijklm} + B_i + C_{ij} + D_{ijk} + E_{ijkl}, \sigma^2)$$

$$B_i \sim N(0, \sigma_B^2)$$

$$C_{ij} \sim N(0, \sigma_C^2)$$

$$D_{ijk} \sim N(0, \sigma_D^2)$$

$$E_{ijkl} \sim N(0, \sigma_E^2)$$

Mathematical Formulation of Random Slope

- Suppose we have multiple observations per student, and multiple students per school
- Or multiple samples per animal and multiple animals per farm
- Or for each farm  $i$  we have several animals  $j$ , each animal was measured at more than one time  $k$ , multiple samples taken at each time  $l$ , and more than one plate  $m$  made of each sample in the laboratory.

Visualization of Random Slope Models

Mathematical Formulation of Random Slope

- The models shown so far didn't make use of the time observations were made
- Two observations from the same individual were correlated, but the correlation was the same regardless of how far apart the observations were in time.
- We might expect observations made 1 day apart to be more similar than those made 10 days apart.
- In other words  $\text{corr}(Y_{ij}, Y_{ik}) = \rho(t_{ij}t_{ik})$ .

Mathematical Formulation of Random Slope

Random effects model with temporal correlation:

$$Y_{ij} | \mathbf{U}, \mathbf{V} \stackrel{\text{iid}}{\sim} \mathcal{N} \left[ X_{ij} \beta + U_i + V_i(t_{ij}), \tau^2 \right]$$

$$U_i \stackrel{\text{iid}}{\sim} \mathcal{N}(0, \sigma_U^2)$$

$$\text{cov}[V_i(t+h), V_i(t)] = \sigma_V^2 \exp(-|h|/\phi)$$

$$\text{cov}[V_i(t+h), V_j(t)] = 0 \text{ if } i \neq j$$
